

Preface

The International Congress "Environment Protection. Energy Saving. Sustainable Environmental Management" is an important platform for scientists, experts, business representatives and the public to meet and find solutions in the field of sustainable development.

This edition contains scientific papers and analytical materials based on the results of the Congress, which reflect current trends in environmental protection, energy efficiency and environmental management. The presented research covers a wide range of issues, from biodiversity conservation and environmental monitoring to the development of renewable energy sources and eco-innovations. Particular attention is paid to technologies for increasing the efficiency of consumption of natural resources, implementation of environmentally friendly solutions in industry and municipal services.

The scientific approach presented in the papers will contribute to the development of practical solutions that can ensure the sustainable development of society and reduce the negative impact on the environment. Discussion of key issues of sustainable development within the framework of the Congress contributed to the formation of a common vision and identification of strategic priorities for the future.

An important role in this process is played by the younger generation of scientists, who are actively involved in the search for innovative approaches and solutions. The results of the presented research can serve as a basis for developing policy decisions and implementing environmental initiatives at the international level. We hope that the materials in this publication will be a source of inspiration for the scientific community, business and the public and will contribute to the dissemination of knowledge and the development of effective environmental strategies.

We sincerely thank all the authors, reviewers and organizers for their contribution to the preparation of this edition and invite you to further cooperation!
