## Preface

## Chapter 1: Diffusion Phenomena on Nanoscale

|                                                                                                                                                                                                                                               |    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| <b>Nanostructure Development of Al-Fe Eutectic Alloy</b><br>A. Hu, S.F. Liu, W.T. Shen, L. Ying and H. Hu                                                                                                                                     | 3  |
| <b>Modelling the Non-Isothermal Flow of a Nanofluid in a Lid-Driven Cavity from the Perspective of Irreversibility Analysis</b><br>E.R. di Schio, K. Iqbal, P. Valdiserri, M. Bouanini and C. Biserni                                         | 13 |
| <b>Electrochemical Potentials of Cobalt Oxide Nanofluid for Improved Oil Recovery with the Aid of Electromagnetic Field</b><br>H. Soleimani, S. Sikiru, H. Soleimani, A. Rostami, L. Khodapanah, M. Yeganeh Ghotbi, N. Rahmanian and M. Sabet | 23 |

## Chapter 2: Mathematical Modelling and Simulations

|                                                                                                                                                                                       |    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| <b>Niobium Solubility in Austenite in the Presence of Niobium Carbides, Nitrides and Carbonitrides</b><br>P.R. Mei                                                                    | 35 |
| <b>Numerical Simulation of Metallurgical Joining of AISI 304 Steel and Ti Grade 2</b><br>E. Babalová and M. Behúlová                                                                  | 53 |
| <b>Study for Hydrogen-Permeable Pd Membrane Using First-Principles Calculation</b><br>K. Ogawa, D. Horikawa, K. Hakamata, T. Nakazawa and S. Kubota                                   | 63 |
| <b>An Investigation of Pedestrian Dynamics Based on Fluid Mechanics Dimensionless Numbers</b><br>A.F. Miguel                                                                          | 73 |
| <b>Geochemical Impacts on CO<sub>2</sub> Storage Efficiency in Deep Aquifers: A Cameroon Gulf of Guinea Case Study</b><br>G. Mwenketishi, H. Benkreira, H. Soleimani and N. Rahmanian | 83 |
| <b>Thermodynamic Modeling of Iron Ore Reduction Using Synthesis Gas</b><br>A.N. Dmitriev, N.M. Barbin, Y.E. Burova and G.Y. Vitkina                                                   | 93 |

## Chapter 3: Experimental Methods in Solids and Liquids

|                                                                                                                                                                                                                             |     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Interdiffusion in <math>\beta</math> Phase Field of Ternary (Ni, Ru)Al System</b><br>S. Kumar and K.N. Kulkarni                                                                                                          | 105 |
| <b>Synthesis of Composite Materials Based Eggshell Reinforced with Silver Nanoparticles for Possible Biomedical Applications</b><br>A. Linares Duarte, E.H. Sánchez, J.G.M. Hernández, Y.S. Fuentes and J.J. Ruíz Domínguez | 115 |
| <b>Measurements of Diffusion Coefficients in Liquid Alloys Using Two Measurement Points of <i>In Situ</i> X-Ray Fluorescence Analysis</b><br>Y. Kobayashi, M. Shiinoki, T. Masaki and S. Suzuki                             | 127 |
| <b>A Study of Diffusion Coefficients: Database and New Device</b><br>A. Ribet, P. Jardin and M. Lalande                                                                                                                     | 139 |
| <b>Induced Residual Stress in Austenitic Stainless Steel F138 after Shot Peening and Plasma Nitriding Surface Treatment</b><br>E.P.R. de Oliveira, R.R. de Oliveira, J.G. Vicente, M. Massi and A.A. Couto                  | 147 |
| <b>Pseudoboehmite for Metformin Release</b><br>E. Lazarin Jr., J.M.B. Silveira, P.C.M. Oliveira, R.M. Peres, I. Barbosa, R.R. Ribeiro, B. Sarmiento, A. Bernussi and A.H. Munhoz Jr.                                        | 157 |
| <b>Effect of Processing and Heat Treatment on the Color of the Water Atomized Steel Shots of High Carbon Steel</b><br>M. Lee, N.E. Battulga and K. Shin                                                                     | 165 |

|                                                                                                                                                                                                                                                              |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Ti-5Mo-xNb Alloys Obtained by Laser Deposition with Potential Use as Biomaterials</b><br>R. Emilio, C.J.R. Lustosa, A. Almeida and O. Florêncio                                                                                                           | 179 |
| <b>Multicomponent Diffusion in Seven- and Eight-Component Silicate Melts</b><br>Y.X. Zhang                                                                                                                                                                   | 189 |
| <b>Microstructural Degradation of Super304H after Long-Term Service Exposure</b><br>L.M. Xu, Y.S. He and K. Shin                                                                                                                                             | 209 |
| <b>Evaluation of Tribological Performance of TiN Films Doped with Copper Deposited by Magnetron Sputtering</b><br>S.N.F. Ribeiro, F.M.d.A. Pereira, R.L.P. Gonçalves, C.A. Monezi, A.A. Couto, K.G. Grigorov and M. Massi                                    | 221 |
| <b>Exploration of Microfluidic Technology for Additive Manufacturing: Devices for Precise Material Dispensing</b><br>E.O. Alvarado-Alcántara, J.A. Beltrán-Fernández, A.T. Velázquez-Sánchez, K.P. Vázquez-Thierry, V. Guzmán-Mercado and C. Alvarado-Moreno | 233 |
| <b>Validation of Velocity in Microchannels with a Retention System due to Unevenness Manufactured by 3D Printing (SLA)</b><br>S.A. Ramos-Ocaña and V.H. Cabrera-Moreta                                                                                       | 243 |

## **Chapter 4: Thermal Diffusion in Solids and Liquids**

|                                                                                                                                                                                        |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Numerical and Experimental Analysis of the Temperature Fields Developed during WAAM Production of an Aluminum Part</b><br>M. Behúlová, M. Sahul, E. Babalová, M. Sahul and T. Němec | 263 |
| <b>Performance Characterization of Cascade Mr-Joule-Thomson Refrigeration System Based on Refrigerant Charge Level</b><br>C.H. Choi, J.W. Bae, S.H. Seol, C.H. Son and J.I. Yoon       | 273 |
| <b>Numerical Evaluation of the Temperature Field inside Specialty Coffee Beans during Microwave Drying</b><br>J.L.G. Corrêa, L.Q. Monteiro, P.G. Silveira and I. Petri Jr.             | 283 |
| <b>Improvement of Interference Fringes Analysis to Obtain Accurate Soret Coefficients</b><br>H. Horikoshi, I. Orikasa, M. Kataoka, Y. Inatomi and S. Suzuki                            | 291 |
