

## Preface

This thematical publication represents the results of the investigation and analysis of structural metals and metallurgical technologies, materials and technologies in biopharmaceutics, and biotechnologies in agricultural production.

Readers will find a series of research results on properties and microstructure and the corrosion behaviour of structural steels and alloys as well as an analysis of some metal processing technologies.

The results of the investigation of materials and technologies in pharmacology based on the processing of natural materials will also be interesting to readers.

In this edition, the research results on biotechnologies in agricultural production are also represented.

This special topic collection will be useful to engineers, academic researchers, and students involved in activities in materials science, machinery, biomedicine and agriculture.
