

Table of Contents

In Memoryof Andries Miedema**FOREWORD****PREFACE****CONTENTS****PART I : INTRODUCTION TO THE MODEL**

1. The Macroscopic Atom Model; Three Fundamentalquantities	1
2. Estimateof the Chemical Part of the Formation Enthalpy of a Dilute Random Solidsolution	3
3. Estimate of the Formation Enthalpy of Anintermetallic Compound	5
4. Volumeeffects upon Alloying	7
5. Solid Solubility	11
6. Some Thermodynamics	18
7. The Importance of the Structural Term	22
8. Surfaceenergy and Enthalpy of Atomisation	23

PART II : APPLICATION OF THE MODEL

1. Application to the Formation and Cohesiveenthalpies of Intermetallic Compounds	26
2. Application to Solid Solubility	27
3. Formation Enthalpy of Concentrated Solidsolutions	28
4. Formationenthalpy of Amorphous Alloys	29
5. Comparison of the Formation Enthalpy of Theamorphous Alloy with the Formation Enthalpy of the Solid Solution	31
6. Formationenthalpy of Ternary Alloys	38
7. Application to Volume Effects upon Alloying	40
8. Applicationonto the Heat of Atomisation. 9. Vacancyformation Enthalpies in Pure Metals and Alloys.	41
10. Anti-Site Disorder in Ordered Compounds	43
11. Vacancy Formation in Ordered Intermetallics	49
12. Anti-Site Disorder versus Triple-Defect Disorderand Schottky Defects F.	52
13. Crystallisation Temperature of Amorphous Alloys	55
14. Metal Surfaces	58

ACKNOWLEDGEMENTS. REFERENCES.**APPENDIX 1.BACKGROUND OF MIEDEMA'S MODEL****2. TABLES****Tablea1. Model Parameters in the Metallicstate**

Table A2. The interfacial Enthalpy of Two Transition Metals

Table A3. The Interfacial Enthalpy of A non-Transition Element in a Transition Metal

Table A4. The Interfacial Enthalpy of a Transition metal in a Non-Transition element

Table A5. Bulk and Shear Moduli of The elements

Table A6. Surface energies and Vacancy Formation Enthalpies of the Elements
