## Chapter 1: Technological Systems of Information and Artificial Intellect in Practice of Production Engineering

|                                                                                                                                       |     |
|---------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>The Operating Diagnostics in the Computer Aided Systems of Production Processes</b><br>P. Wittbrodt and A. Paszek                  | 3   |
| <b>Assumptions and Algorithms for Scheduling Low-Volume Production</b><br>J. Czajka and M. Cholewa                                    | 10  |
| <b>Application of Decision Tables in Technological Knowledge Representation</b><br>A. Paszek and P. Wittbrodt                         | 18  |
| <b>Integration of CAD/PDM and ERP Systems in Practice</b><br>J. Mleczko                                                               | 26  |
| <b>Introduction to Basic Integration of Measurement Devices with Cloud Computing Services</b><br>T. Cieplak and P. Muryjas            | 34  |
| <b>The Application of Cloud Computing with the Internet of Things</b><br>M. Kulisz and J. Pizoń                                       | 42  |
| <b>Use of Cloud Computing in Project Management</b><br>J. Słonec                                                                      | 49  |
| <b>Statistical Methods in the Automotive Industry</b><br>E. Golińska and M. Zemczak                                                   | 56  |
| <b>Optimal Production Planning for a Random Horizon</b><br>A. Gola and E. Kozłowski                                                   | 63  |
| <b>Mass Customized Projects Portfolio Scheduling - Imprecise Operations Time Approach</b><br>K. Bzdya, G. Bocewicz and Z. Banaszak    | 70  |
| <b>Management of Projects Realization Process in Enterprises of ICT Sector</b><br>A. Kaczorowska, S. Motyka and J. Zieliński          | 81  |
| <b>Manufacturing Process Support Using Artificial Intelligence</b><br>J. Pizoń and J. Lipski                                          | 89  |
| <b>GPS Technology Application as a Tool of Streamlining the Operations of a Transport Business and Economic Analysis</b><br>P. Bernat | 96  |
| <b>Economic Forecasting of the Transportation Services Using Analytic Approach</b><br>Ł. Wojciechowski and T. Cisowski                | 102 |
| <b>Synthesis of Decision Models and Algorithms in Manufacturing Systems</b><br>Ł. Wojciechowski, P. Pazowski and T. Cisowski          | 108 |

## Chapter 2: Designing and Modeling of Manufacturing Systems

|                                                                                                                                                    |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Interactive Generation of Spatial Solutions for Manufacturing Systems by Means of Virtual Reality</b><br>M. Hajduk and J. Kováč                 | 119 |
| <b>Mathematical Models for Manufacturing Systems Capacity Planning and Expansion – An Overview</b><br>A. Gola, M. Relich, G. Kłosowski and A. Świć | 125 |
| <b>Human Resource Selection for Manufacturing System Using Petri Nets</b><br>G. Kłosowski, A. Gola and A. Świć                                     | 132 |
| <b>Modeling of Economic Forecasting of Manufacturing Processes in Transport Services Market</b><br>Ł. Wojciechowski and T. Cisowski                | 141 |
| <b>The Formalization and Generalization of Preferences for Transport Safety Project Design</b><br>M. Jakubowski, M. Charlak and T. Szot            | 146 |

|                                                                                                       |     |
|-------------------------------------------------------------------------------------------------------|-----|
| <b>Evaluation of Measurement Systems According to ISO/TS 16949 and Customer Specific Requirements</b> |     |
| D. Pllinta, E. Golińska and A. Kulesz                                                                 | 153 |

## **Chapter 3: Design and Use of Robots**

|                                                                                                                                 |     |
|---------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Trends in Industrial and Service Robot Application</b>                                                                       |     |
| M. Hajduk and L. Koukolová                                                                                                      | 161 |
| <b>Optimization of Selected Parameters of Modular Assembly Robot</b>                                                            |     |
| R. Kluz and T. Trzepieciniski                                                                                                   | 166 |
| <b>3D Model of the Robot OTC Created by Digital Photogrammetry</b>                                                              |     |
| V. Baláž                                                                                                                        | 174 |
| <b>Perspective and Methods of Human-Industrial Robots Cooperation</b>                                                           |     |
| Ł. Sobaszek and A. Gola                                                                                                         | 178 |
| <b>Identification of Randomly Distributed Objects</b>                                                                           |     |
| R. Jánoš and J. Varga                                                                                                           | 184 |
| <b>Point Cloud Based Bin Picking: Object Recognition and Pose Estimation Using Region Growing Segmentation Algorithm</b>        |     |
| F. Durovsky                                                                                                                     | 189 |
| <b>Design of Robotized Workplace for Verification of Selected Types of Algorithms and Methods for Randomly Oriented Objects</b> |     |
| M. Vagaš and J. Sejmon                                                                                                          | 195 |

## **Chapter 4: Modern Materials and Engineering Decisions for Manufacture**

|                                                                                                                                     |     |
|-------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Adhesive Joining in Ball and Tapered Roller Bearings</b>                                                                         |     |
| A. Rudawska and G. Talatycki                                                                                                        | 203 |
| <b>The Influence of the Shape of a Polymer Wall on Selected Mechanical Properties</b>                                               |     |
| T. Klepka and P. Zaprawa                                                                                                            | 211 |
| <b>Dynamics of Two-Phase Flow through a Minichannel: Fourier and Multiscale Entropy Analyses</b>                                    |     |
| G. Górski, G. Litak, R. Mosdorf and A. Rysak                                                                                        | 217 |
| <b>Comparative Analysis of Shear Strength of Single-Lap Adhesive Joints after "Thermal Shock"</b>                                   |     |
| M. Kłonica                                                                                                                          | 224 |
| <b>Dynamic Diameter Determination of Circular Brushes</b>                                                                           |     |
| J. Matuszak and K. Zaleski                                                                                                          | 232 |
| <b>Analysis of the Process of Turning of Low-Rigidity Shafts</b>                                                                    |     |
| A. Świć, V. Taranenko and A. Gola                                                                                                   | 238 |
| <b>The Surface Free Energy after Laser Beam Treatment</b>                                                                           |     |
| B. Ciecińska                                                                                                                        | 246 |
| <b>The Effect of Alloy Cast Iron Hardness on the Tribological Properties of a Bronze – Cast Iron Pair in Dry and Mixed Friction</b> |     |
| H. Czarnecki                                                                                                                        | 252 |
| <b>Comparison of Surface Free Energy Calculation Methods</b>                                                                        |     |
| J. Domińczuk and A. Krawczuk                                                                                                        | 259 |
| <b>Optimal Controlling the Dynamical System of Machine Tool by Elastic-Deformable Shafts Machining</b>                              |     |
| J. Zubrzycki, A. Świć and M. Opielak                                                                                                | 266 |
| <b>Step-by-Step Machining of Spur Gears with Longitudinal Tooth Modification</b>                                                    |     |
| T. Nieszporek, A. Piotrowski, P. Boral and K. Potiomkin                                                                             | 272 |
| <b>Dynamic System of Grinding of Low-Rigidity Shafts</b>                                                                            |     |
| A. Świć, V. Taranenko, A. Gola and M. Opielak                                                                                       | 281 |
| <b>Energy-Absorbing Cab Support of Forest Machine</b>                                                                               |     |
| A.V. Pitukhin, V. Kostyukevich and I. Skobtsov                                                                                      | 290 |

|                                                                                                                                                                     |     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>The Design and Analysis of the Hydraulic Workpiece Clamping System in the Milling Machining Process</b>                                                          |     |
| K. Potiomkin, T. Nieszporek, A. Piotrowski and P. Boral                                                                                                             | 297 |
| <b>Step-by-Step Machining of Cylindrical Worms with a Preset Axial Profile</b>                                                                                      |     |
| T. Nieszporek, A. Piotrowski, P. Boral and K. Potiomkin                                                                                                             | 306 |
| <b>Air Flow Conditions for Polymer Energy Harvesting</b>                                                                                                            |     |
| R. Raczynski and G. Litak                                                                                                                                           | 315 |
| <b>The Analysis of Selected Rheological Models of the Cement Dispersion in the Pipe Flow</b>                                                                        |     |
| J. Szerafin and P. Zaprawa                                                                                                                                          | 321 |
| <b>The Use of Computer Systems in the Design of Hip Replacements</b>                                                                                                |     |
| P. Penkała and K. Kiryczuk                                                                                                                                          | 328 |
| <b>Application of IT Methods for the Identification and Analysis of EEG Signals</b>                                                                                 |     |
| J. Zubrzycki, K. Jonak, G. Opielak, P. Krukow and R. Maciejewski                                                                                                    | 335 |
| <b>Parameters Tuning of an Immune Algorithm for Time-Series Pattern Recognition to Improve Ability to Escape from a Local Optimum and Achieve a Better Solution</b> |     |
| I. Paprocka, A. Gwiazda and B. Skołud                                                                                                                               | 342 |
| <b>Designing Complex Technical Means Using the Integrative Approach for Construction Optimization</b>                                                               |     |
